Hanksite -- Na₂₂K(SO₄)₉(CO₃)₂CI

Hanksite is a sulfate mineral which formed in the lakebed of Searles Dry Lake during the last Ice Age. The lake was part of a chain which ended in Lake Manly, now Death Valley. This particular

Hanksite -- Na₂₂K(SO₄)₉(CO₃)₂CI

Hanksite is a sulfate mineral lakebed of Searles Dry Lake during the last Ice Age. The lake was part of a chain which ended in Lake Manly, now Death Valley. This particular

Hanksite -- Na₂₂K(SO₄)₉(CO₃)₂CI

Hanksite is a sulfate mineral which formed in the lakebed of Searles Dry Lake during the last Ice Age. The lake was part of a chain which ended in Lake Manly, now Death Valley. This particular

Hanksite -- Na₂₂K(SO₄)₉(CO₃)₂CI

Hanksite is a sulfate mineral which formed in the lakebed of Searles Dry Lake during the last Ice Age. The lake was part of a chain which ended in Lake Manly, now Death Valley. This particular

${\rm Hanksite -- Na_{22}K(SO_4)_9(CO_3)_2CI}$

Hanksite is a sulfate mine n formed in the lakebed of Searles Dry Lake during the last Ice Age. The lake was part of a chain which ended in Lake Manly, now Death Valley. This particular

$Hanksite -- Na_{22}K(SO_4)_9(CO_3)_2CI$

Hanksite is a sulfate mineral which formed in the lakebed of Searles Dry Lake during the last Ice Age. The lake was part of a chain which ended in Lake Manly, now Death Valley. This particular

Hanksite -- Na₂₂K(SO₄)₉(CO₃)₂CI

e mineral which formed in the Hanksite is a sulfa lakebed of Searles Dry Lake during the last Ice Age. The lake was part of a chain which ended in Lake Manly, now Death Valley. This particular

Hanksite -- Na₂₂K(SO₄)₉(CO₃)₂CI

Hanksite is a sulfate mineral which formed in the lakebed of Searles Dry Lake during the last Ice Age. The lake was part of a chain which ended in Lake Manly, now Death Valley. This particular

Hanksite -- Na₂₂K(SO₄)₉(CO₃)₂CI

Hanksite is a sulfate mineral which formed in the lakebed of Searles Dry Lake during the last Ice Age. The lake was part of a chain which ended in Lake Manly, now Death Valley. This particular

Hanksite -- Na₂₂K(SO₄)₉(CO₃)₂CI

Hanksite is a sulfate mineral which formed in the lakebed of Searles Dry Lake during the last Ice al which formed in the Age. The lake was part of a chain which ended in Lake Manly, now Death Valley. This particular

crystal was dug out of the mud by Searles Valley Minerals (parent company Nirma, Ahmedabad, India) during the Gem-O-Rama field trip. Hanksite, along with other minerals in the Lake, is mined by dissolving and collecting it with injection wells,
